

Final Assignment Overview

Estimated Time: 15 mins

Instructions

Now it's your turn to demonstrate your understanding of data science methodology.

During this final project you'll demonstrate your knowledge of CRISP-DM data methodology.

For this project, you will step into two roles:

The Client – Imagine yourself as the business stakeholder. Your job is to define a real-world business problem in one of the following domains: **Emails, Hospitals, or Credit Cards**. Think about the challenges faced in this area and phrase the problem as a **data-driven question** that could be answered through analysis.

The Data Scientist – Once the problem is defined, you will switch perspectives and take on the role of the data scientist. Here, you will **apply the CRISP-DM stages** to explain how data could be used to solve the problem. At each stage, you will describe the approach you would take and the reasoning behind it, bridging the gap between the business need and a data-driven solution.

By the end of this assignment, you will have **hands-on experience applying CRISP-DM to a real-world business challenge**. This will strengthen your ability to connect business needs with data-driven solutions, an essential skill for every data scientist.
